

SYSTEM FOR PARKING

This system elegantly and efficiently solves the problem of parking

- The parking system has several advanced functions:

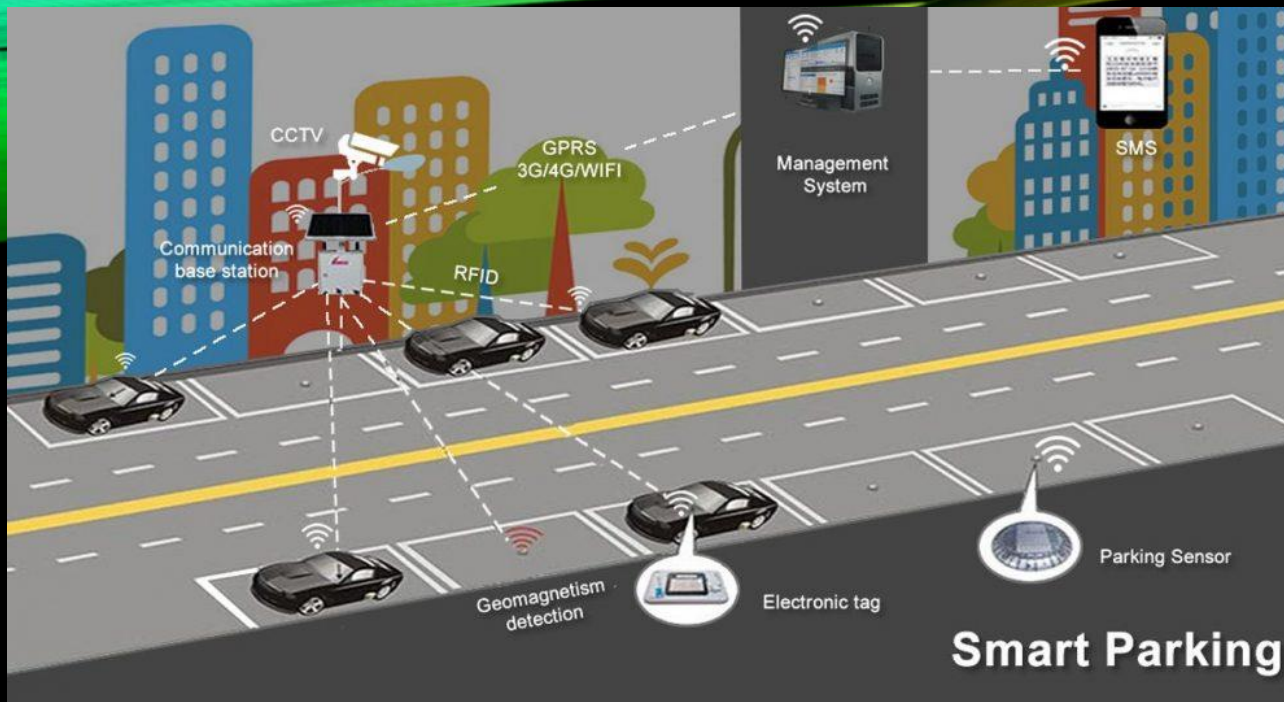

1. Notifying of free parking spaces

Through the application, users can effortlessly access information about available parking spaces directly on their phones. The city's map displays free spaces in green and occupied ones in red, allowing for quick and easy navigation to the nearest available parking option.

2. automatic parking payment

- When the user parks in a designated parking space, the system performs three functions:
- Notifies through the application that the place is occupied, and the applications will be managed in this way until further notice.
- Notifies to the user that he has parked the vehicle correctly or incorrectly, if he has not parked correctly, he must make a correction and pay for parking via the application.
- Parking payment through the application, after successful parking, the system recognizes the license plates on the vehicle and compares the data provided by the user, informs the user about the expiration of the parking and to extend the parking or repark accordingly.

- This system elegantly and efficiently solves the problem of parking.
- Apart from the control of the entire system of parking spaces, users are better informed about free parking spaces, this way we get satisfied users and service providers.
